

For something that I passively vibe-coded, this app works surprisingly well. Perhaps that just speaks to the strengths of PencilKit, as this is basically Apple Notes.

I still need to get Tailscale and the Cheeseplease machine setup so that I have the notes hosted somewhere reliable and accessible.

I also need to get public/private publishing sorted out, and I should probably remove the Cron job that auto builds my forest

Other thoughts:

- Should be able to hide top bar while writing a note.
- TODOS to linking would be nice from within here
 - ↳ Maybe an OCR pass on save? Then use a small LLM to suggest action items?
- Can't / edit source of trees because they're not on this machine
 - ↳ They should be
- Zooming in on this canvas
- Auto sync to Git
- Message the Forester mailing list

Is this going to be a battery hog?
