

With the addition of handwritten notes on this iPad, I am still unsure what the correct design is for integration across machines

There is a coherence issue to handle between devices. I may want to use my homeserver on the tailnet acting as a central authority. However, I don't want to disrupt any of the cadence in an offline-first workflow.

As a first attempt I think that it makes sense for the iPad to be a single source of truth for handwritten assets and something else to be the authority on digital notes—perhaps the homeserver, my laptop as a server, or even just a git repository.

Important things to understand for handwritten notes

- ↳ storage format
- ↳ Backup plan
- ↳ sync strategy

Additionally there are still open questions of interaction mode for a handwritten note.

Should there be transclusions? Datalog queries? Distinct taxonomies? Inline todes?

Honestly inline todes should be a thing for textual notes as well

What/when do I OCR? Can OCR be cleaned with the use of a lightweight LLM?

Can diagrams be OCR'd?

If I split into sections a la

This Is a New Section Header

should this be a new tree?

How to do zettelkasten easily?
